Abstract. We present an application called Konf-Connect to improve
the conference attending experience of the people who attend a con-
ference. This tool provides search facilities to find people with similar
interests. The application makes use of Semantic Web dog food dataset
to gather information regarding the conference at hand. This is help-
ful for people attending the conference who are looking for networking
opportunities with people having expertise in the specific areas of inter-
est. The application can also be extended to be used as general purpose
expert search system.

⋆ authors are alphabetically ordered on last names but does not necessarily reflect the
contribution of each author.
